Clear Intelligence

by VisionX Software

Responsible background verification

Identity, employment, professional credentials and post-hire monitoring workflows bring evidence into context. Source availability depends on configured services.

Human decisions, supported by evidence

Record lawful purpose, consent and required approval. Review match uncertainty and source limitations. An unconfirmed match is not evidence of wrongdoing.

Secure workspaces

Authenticator-app sign-in, fresh verification for sensitive actions and organization-scoped access are central to the product standard. Prepared upgrades remain subject to owner approval.

Resources

Online user and administrator guides, an interactive fictional tour and a captioned walkthrough are available from the Resources menu on the product website.

Trial safeguards

Trial activation is OFF by default. Trials require two-factor sign-in and approved usage limits. Expired trial data is retained read-only; platform administrators control extension.
